A summit by ~~top scientists~~
called for the need of
“resolutions in the **tens of kilometres**, at least. And even
higher resolutions — a
kilometre or less” to
revolutionize climate science

(Nature, 2008)

NICAM was opening
that door,
powered by the Earth
Simulator@JAMSTEC.

Today

Summit, USA

Sunway TaihuLight, China

100-200 PFlop/s

Mistral, DKRZ

K computer, RIKEN

Oakforest PACS, Univ. Tokyo

4 - 25 PFlop/s

Post-K computer “富岳 Fugaku” 2021 ~
100 times faster than “京 K” ?

So, isn't it time for a

“revolution” of climate science?

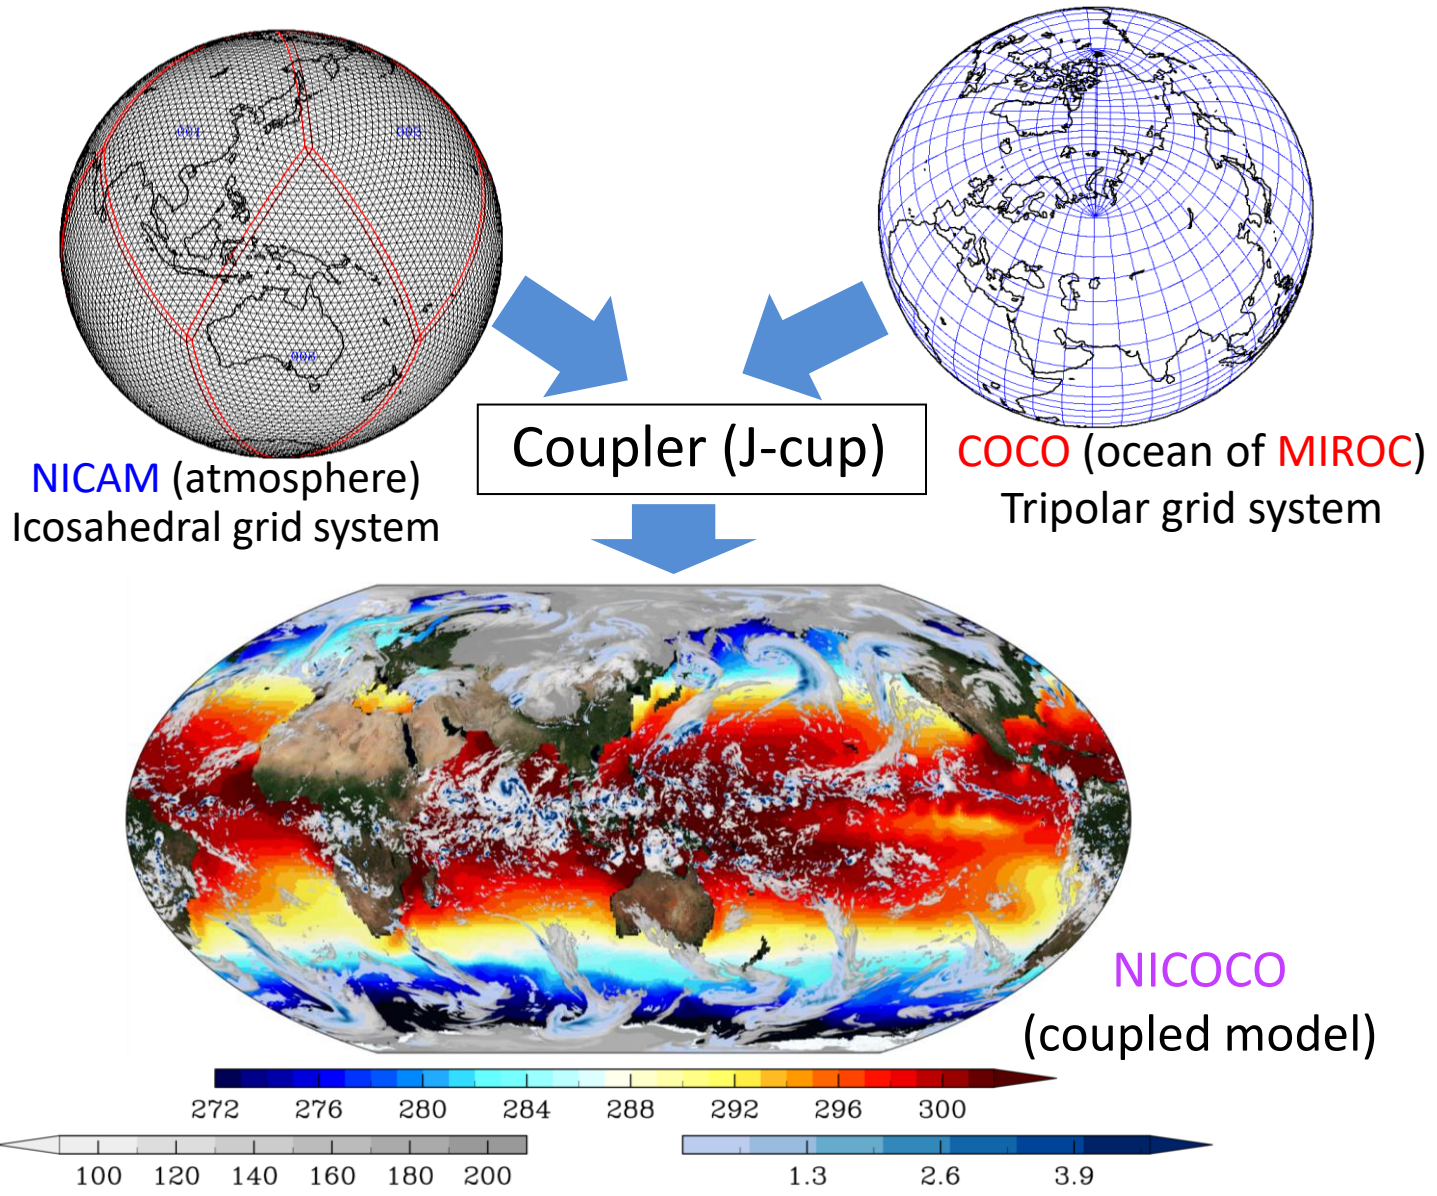

(at least at S2S / S2D scales?)

The **ocean** component is a
key ingredient, especially for climate simulations

Unfortunately, NICAM stands for...

Nonhydrostatic **I**Cosahedral **A**tmospheric **M**odel

uh oh.

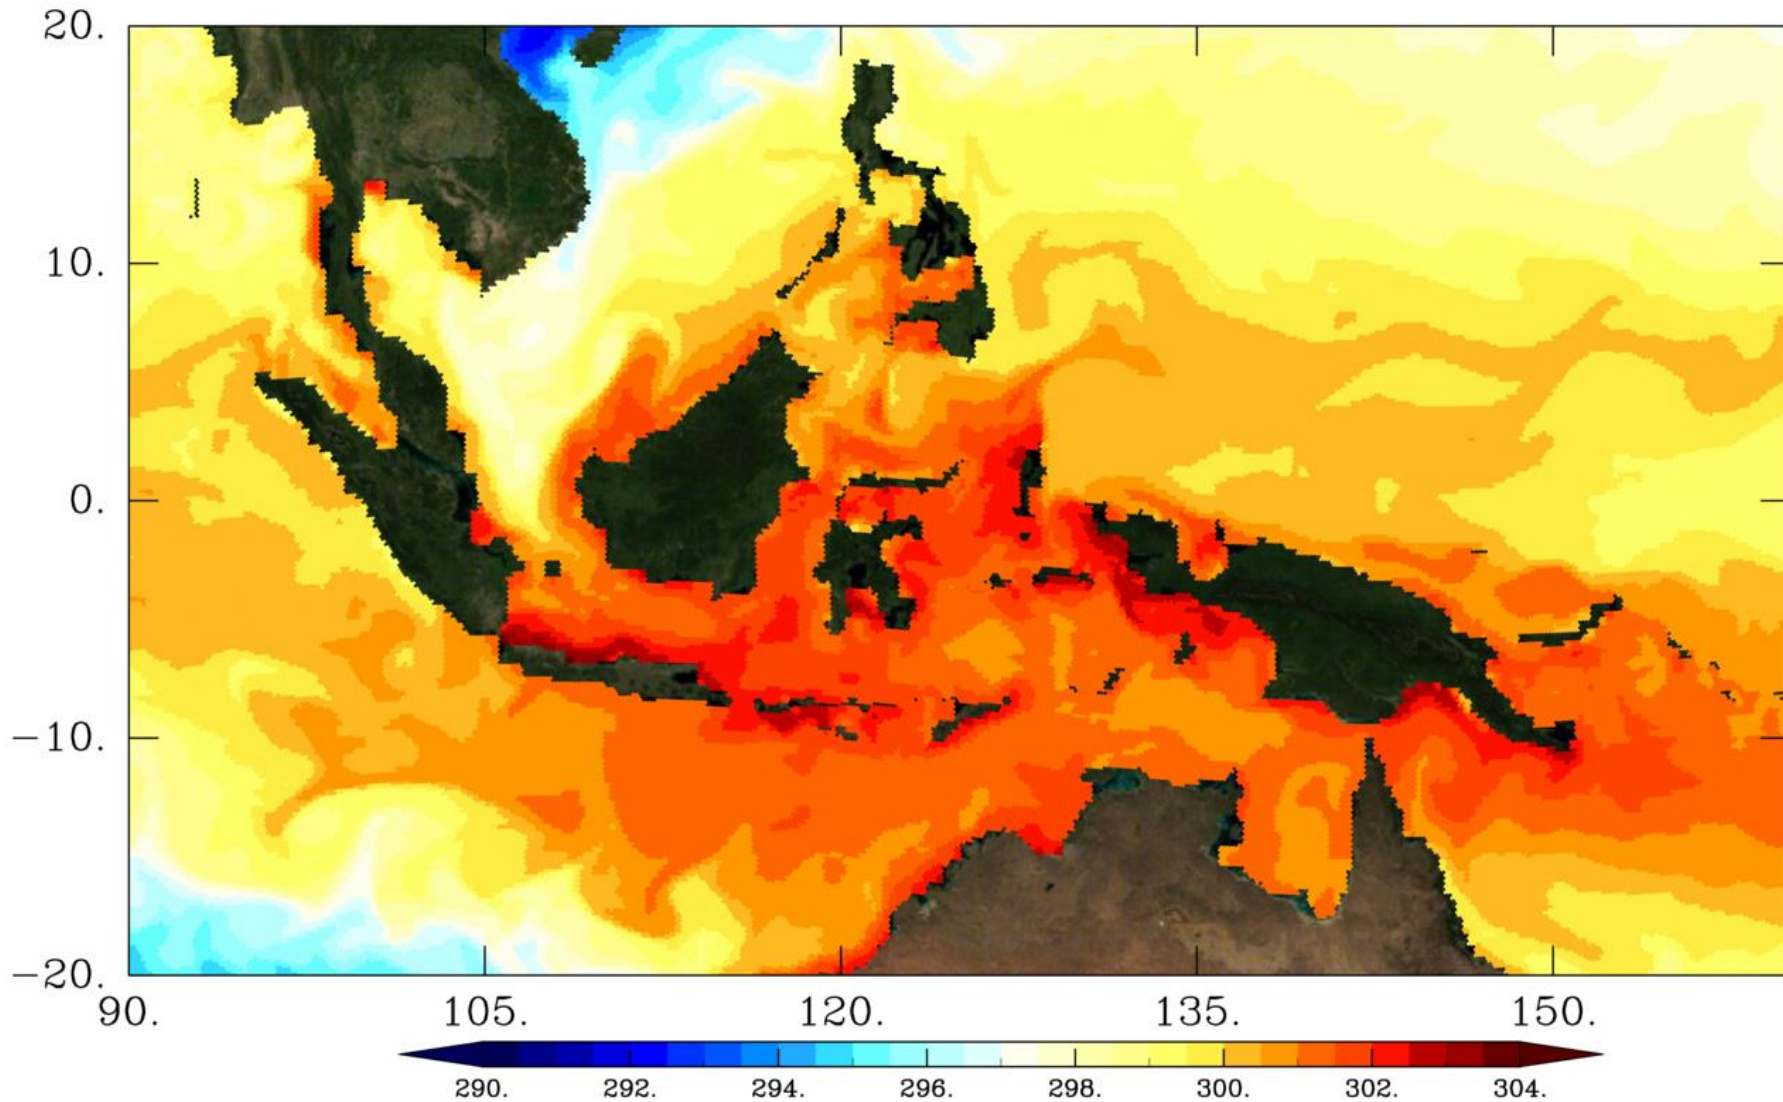

2011/12/10-23:00:00 - 2011/12/11-00:00:00

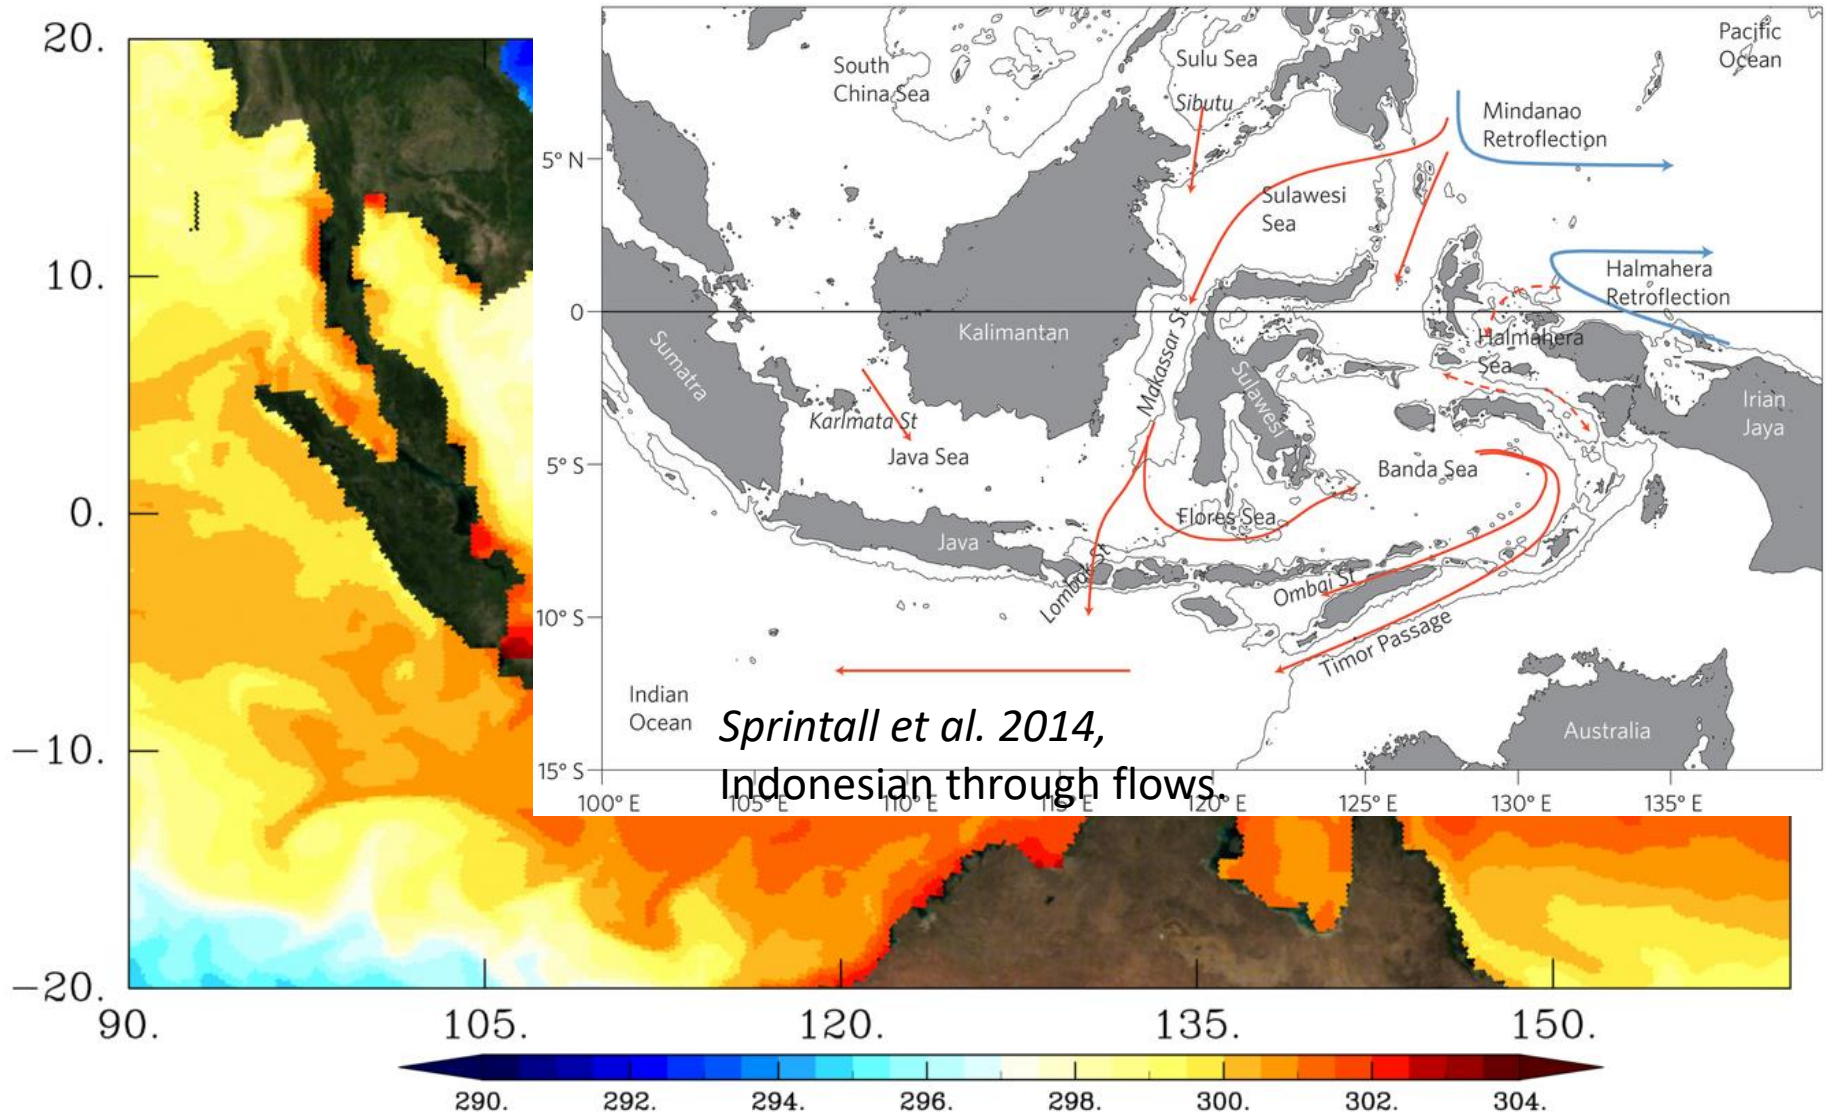

Eastern Pacific TIW
looking better. (1 deg ver.)

NICOCO 0.25deg

NICO CO 0.25deg

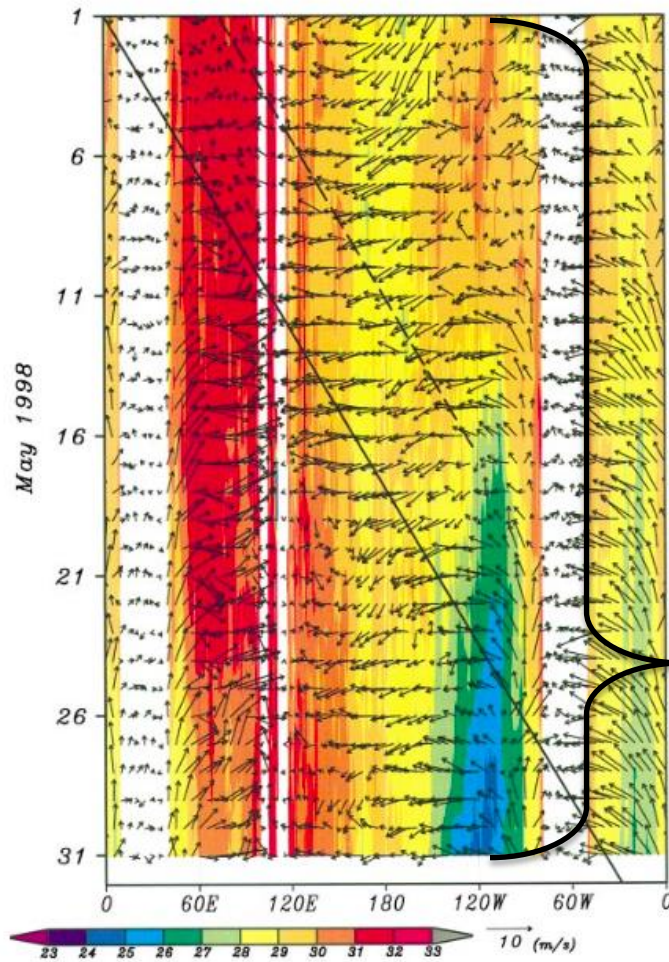

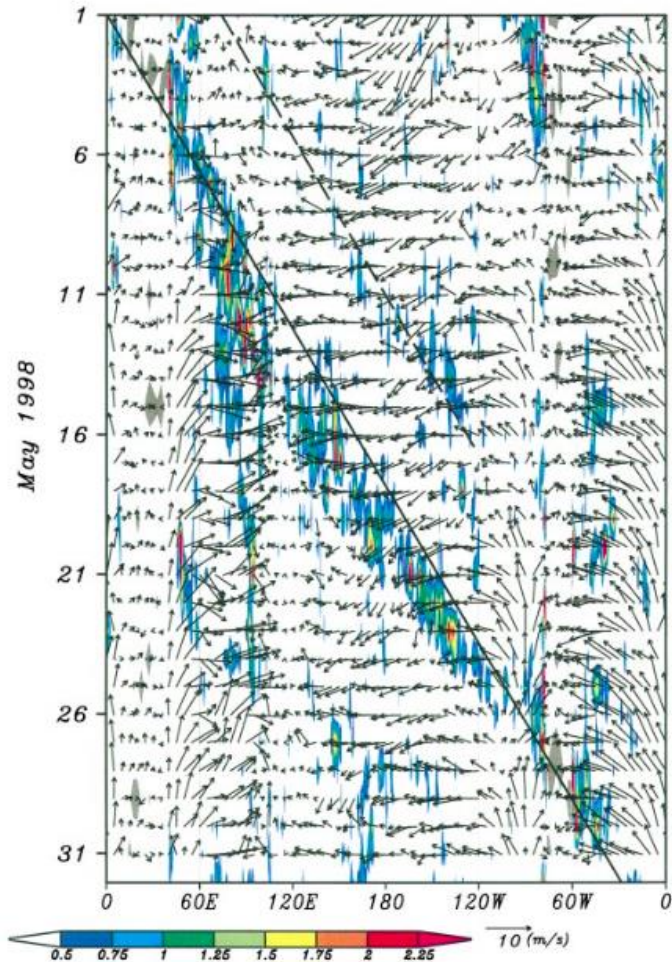

NICOCO 3.5km atm + 0.1deg ocean
“Cloud & eddy resolving” simulation

@ Oakforest PACS
Thx to Hisashi Yashiro

(Example of NICOCO usage)

Target MJO event (May, 1998)

8 K temperature
drop in 30 days.
McPhaden 1999.

Takayabu et al. 1999,
MJO abruptly finishing off giant El Nino?

NICOCO, 9 members (Initial dates: Apr. 20 - Apr. 28, 1998)

(* Drift is estimated from 54 MJO exp and subtracted offline)

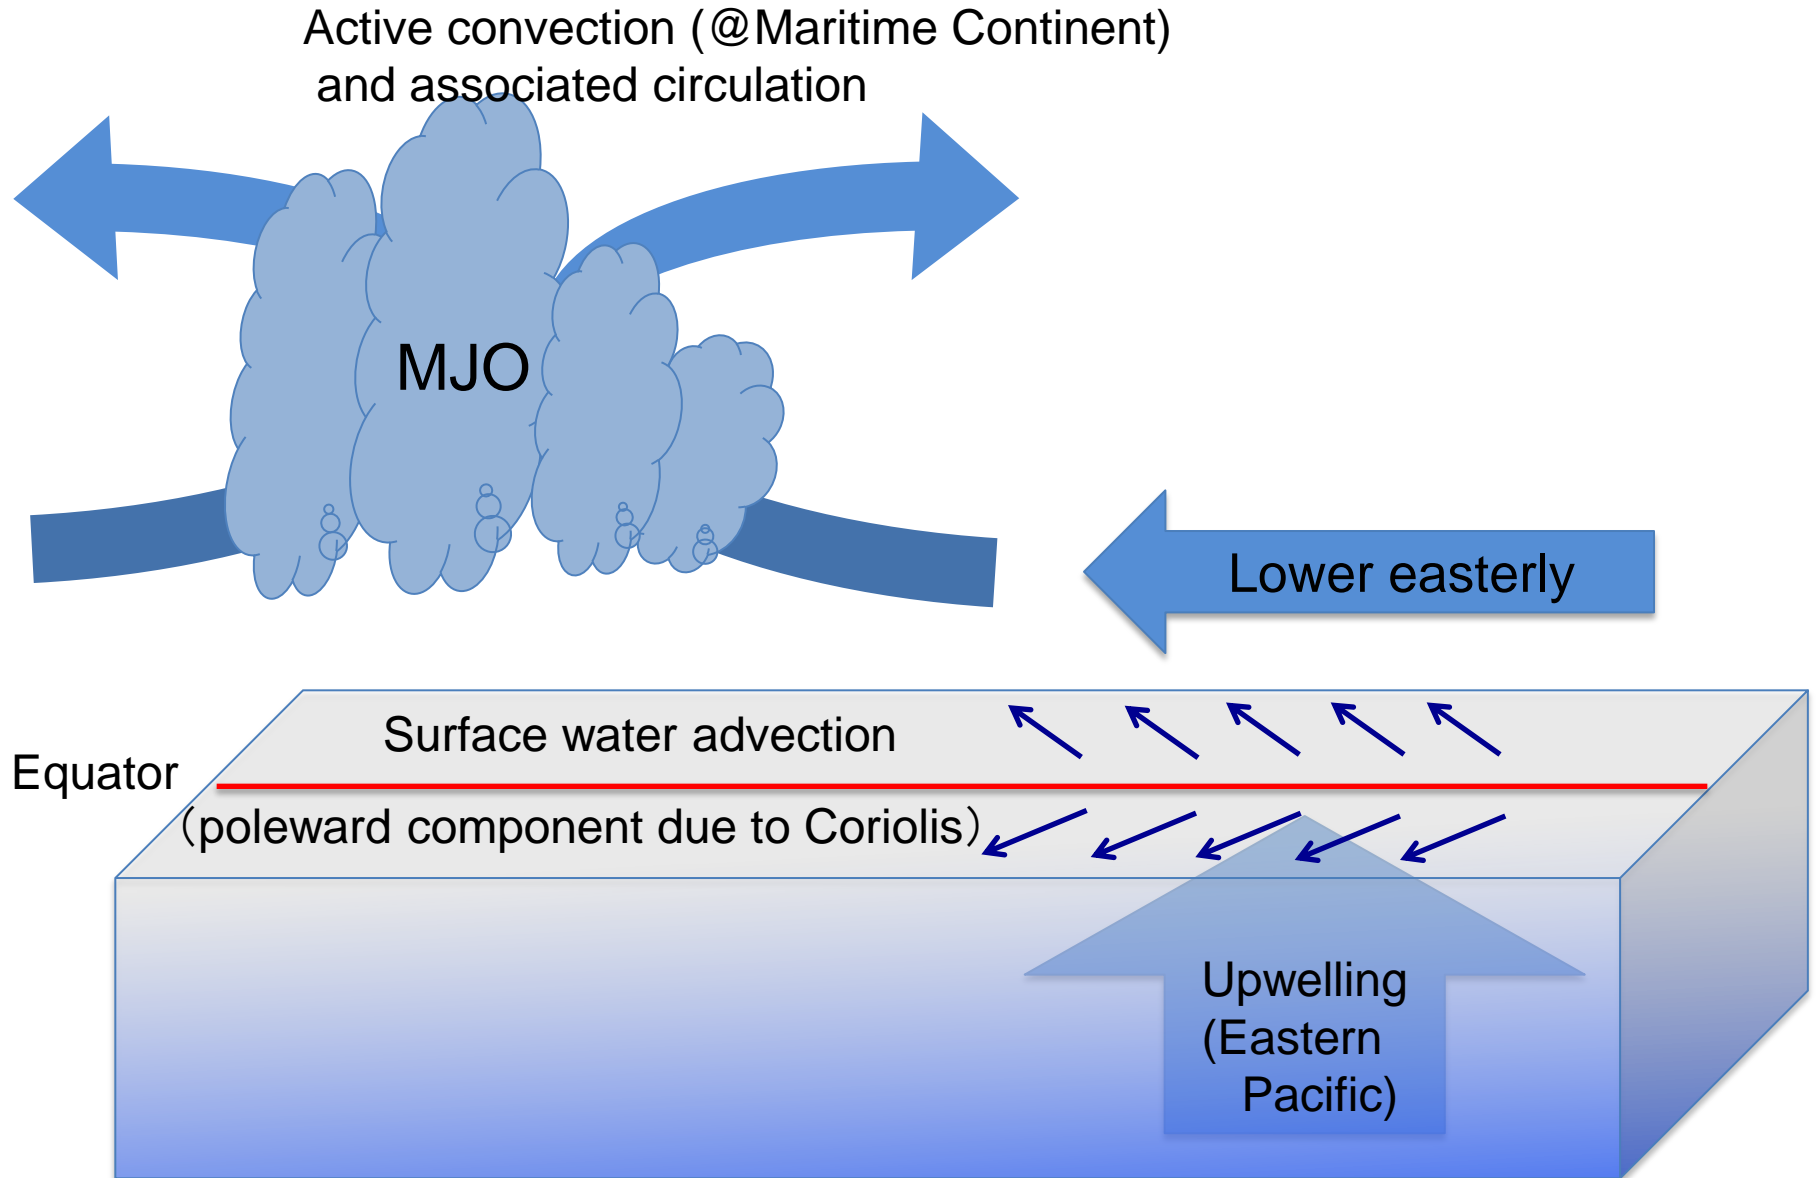

ENSO

MJO prediction

MJO remotely enhancing upwelling of cold subsurface water

Ocean-coupled global cloud resolving simulations may open the way for:

- Better understanding of **Atmos.-Ocean interaction over oceanic fronts** (Kuroshio, TIW, gulf stream, etc.)
- Improved **prediction of ENSO, MJO**
- Seasonal prediction for **typhoon genesis**
- Improved seasonal forecast of mid-latitude **blocking events**

and more.

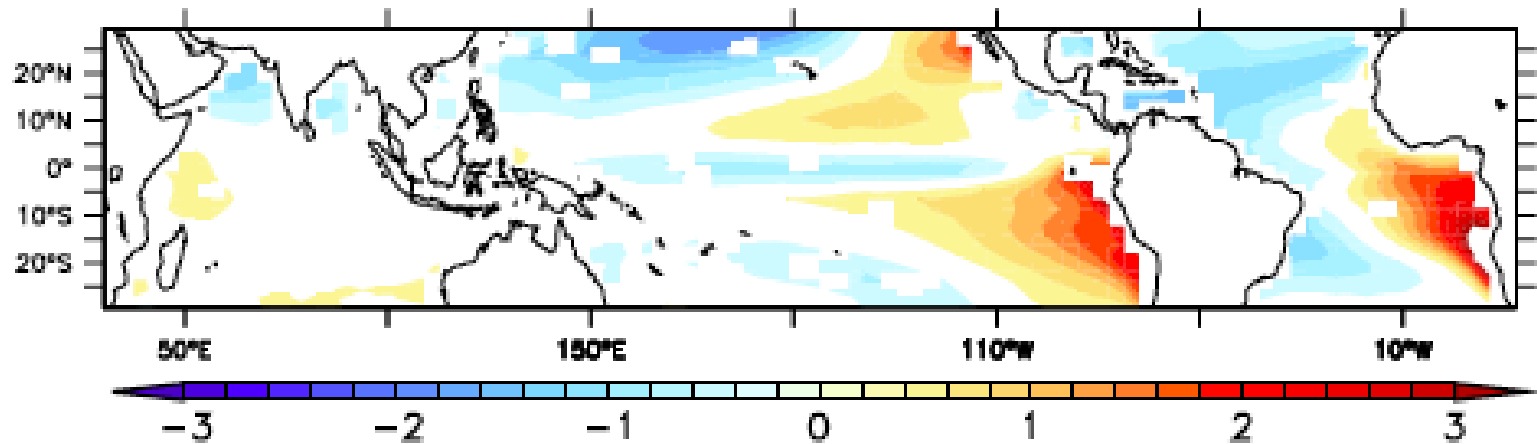

The big issue going forward:

SST Bias

(a) NICOCO (14-km atm & 1 deg ocn) SST Bias, day 100

(b) SST (CMIP5 CPL composite - OBS) pattern (°C)

Mean SST bias of CMIP5 coupled historical simulation (Găinușă-Bogdan et al., 2018)

Mean drift (SST, 850 wind: NICOCO 14 km atm, 1 deg ocean)

Day 10

Day 30

Day 50

Day 70

Current status of NICOCO SST bias

- SST bias for NICOCO (14km-1deg) is very similar to CMIP5 GCMs.
- Overestimation of trade wind is likely the cause.
- Sensitivity tests of SST bias to resolutions of atmosphere (7 km, 3.5 km) and ocean (0.25 deg, 0.1 deg) ocean are under way.

Summary

- **Global cloud-resolving models** are quickly becoming an accessible tool world-wide.
- **Ocean-coupled** versions of GCRMs have been expected to “**revolutionize climate science**” (at **S2S/S2D scales** for a start)
- NICOCO (ocean-coupled NICAM) show promising results, and can now execute “**global cloud and eddy resolving**” simulations
- We really need to work on **SST bias**

Summary

- **Global cloud-resolving models** are quickly becoming an accessible tool world-wide.
- **Ocean-coupled** versions of GCRMs have been expected to “**revolutionize climate science**” (at **S2S/S2D scales** for a start)
- NICOCO (ocean-coupled NICAM) show promising results, and can now execute “**global cloud and eddy resolving**” simulations

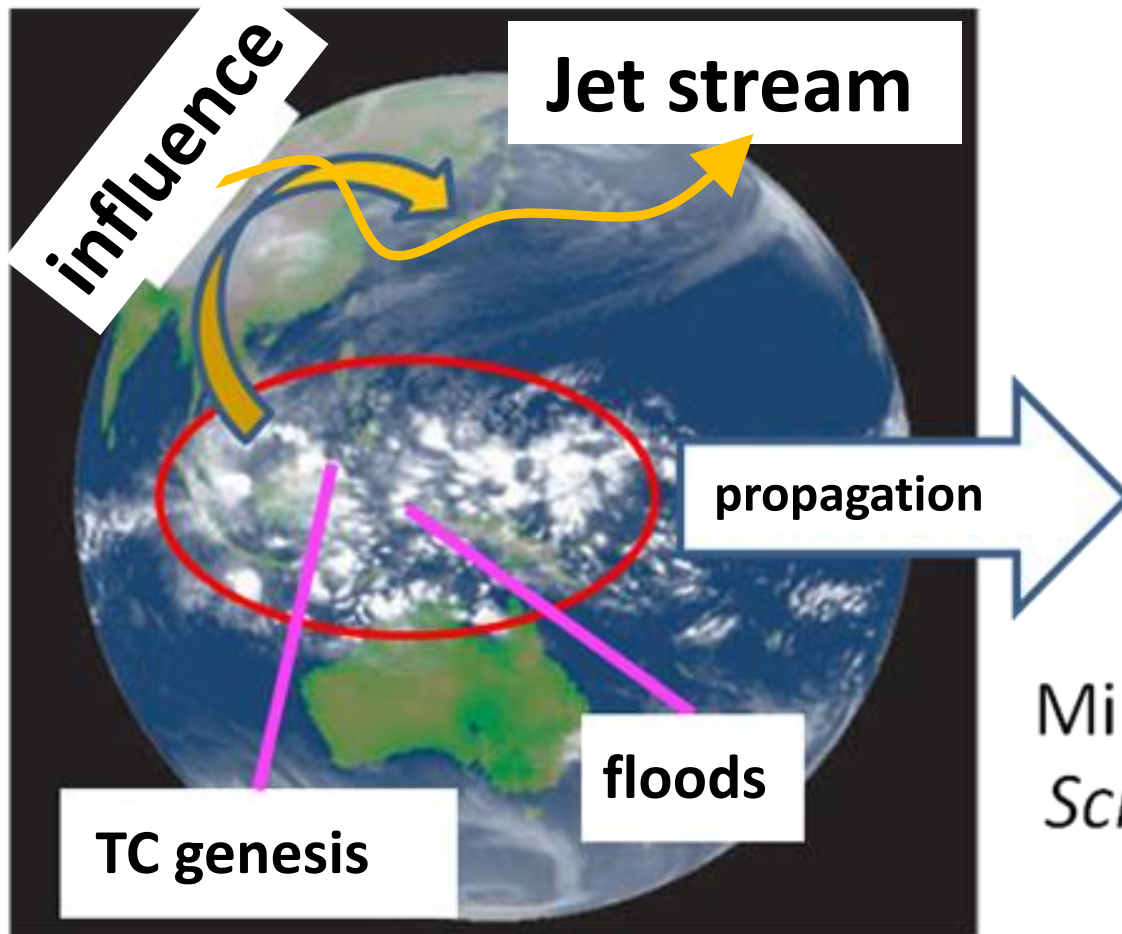

▪ We really need to work on **SST bias**

---> I came here to find collaborators 

Happy Hacking!

A Key to sub-seasonal/seasonal prediction :
Madden-Julian oscillation (MJO)

Miura et al. 2007
Science (edited)

SST used for atmospheric NICAM MJO skill evaluation

SST used for nudging the mixed-layer ocean model

= time varying seasonal cycle + anomaly

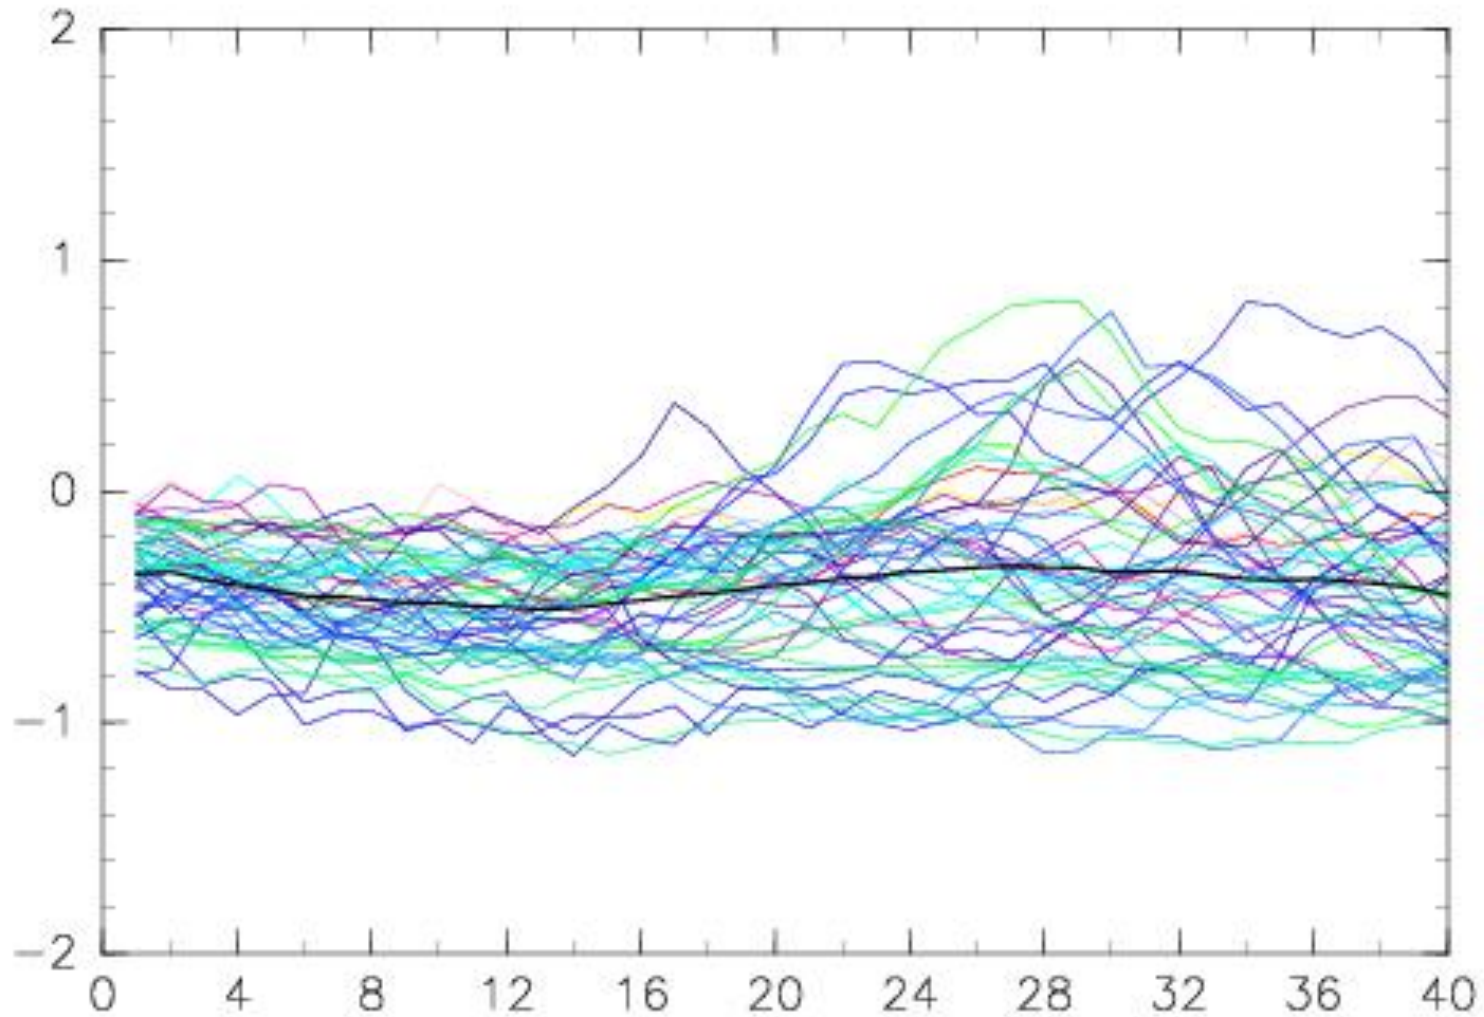

Allows “forecast mode” simulations, but performance get worse when ocean anomalies change rapidly.

NICOCO 0.25deg

NINO3.4, model bias

Mean bias (SST, OLR, 850 wind: NICOCO 53 cases)
